

10. Array Minimum no. of Jumps to reach end of an array

```
class Solution {
public:
    int minJumps(vector<int>& arr) {
        int n = arr.size();
        if(n <= 1) return 0;      // Already at last index
        if(arr[0] == 0) return -1; // Can't move anywhere

        int maxReach = arr[0];    // How far we can go from start
        int steps = arr[0];       // Steps we can still take
        int jumps = 1;           // We must take at least one jump

        for(int i = 1; i < n; i++) {
            // If we've reached the end
            if(i == n-1) return jumps;

            maxReach = max(maxReach, i + arr[i]);
            steps--;

            // If no steps left, we must jump
            if(steps == 0) {
                jumps++;

                if(i >= maxReach) return -1; // If we can't move further

                steps = maxReach - i;
            }
        }
        return -1;
    }
};
```

The screenshot displays a coding platform interface with a dark theme. On the left, the 'Output Window' shows 'Compilation Results' for 'Custom Input' by 'Y.O.G.I. (AI Bot)'. A green checkmark indicates 'Problem Solved Successfully'. Below this, a table shows 'Test Cases Passed' as 1120/1120, 'Attempts' as 1/1, 'Accuracy' as 100%, 'Points Scored' as 4/4, and 'Time Taken' as 0.22. At the bottom, 'Solve Next' buttons for 'Maximum Index', 'Jump Game', and 'Wine Buying and Selling' are visible. On the right, the C++ code for the 'minJumps' function is shown, matching the code in the previous block. The code is numbered 1 to 31. A 'Start Timer' button is at the top right of the code editor.
