

19. Array Subset

```
class Solution {
public:
    // Function to check if b is a subset of a
    bool isSubset(vector<int> &a, vector<int> &b) {
        unordered_map<int, int> freq;
        // Count frequencies in array a
        for (int x : a) {
            freq[x]++;
        }
        // Check frequencies for array b
        for (int x : b) {
            if (freq[x] == 0) {
                return false; // element missing
            }
            freq[x]--;
        }
        return true;
    }
};
```

The screenshot displays a coding platform interface with a dark theme. On the left, the 'Output Window' shows 'Compilation Results' for 'Custom Input' by 'Y.O.G.I. (AI Bot)'. It confirms 'Problem Solved Successfully' with 1114/1114 test cases passed, 1/1 points scored, and a total score of 65. The 'Solve Next' section lists 'Counting elements in two arrays' and 'Union of 2 Sorted Arrays'. On the right, the C++ code editor shows the solution for 'Array Subset' (C++ 17), which uses an unordered_map to count frequencies in array 'a' and then checks if array 'b' is a subset. The code is 23 lines long. A 'Start Timer' button is visible at the top right of the editor. A small sidebar on the far right shows a search bar and a summary of the problem solution.
