

2 . find a minimum and maximum element in array

code:-

```
class Solution {
public:
    vector<int> getMinMax(vector<int> &arr) {
        int n = arr.size();
        int minVal = arr[0];
        int maxVal = arr[0];

        // Traverse the array once
        for (int i = 1; i < n; i++) {
            if (arr[i] < minVal)
                minVal = arr[i];
            if (arr[i] > maxVal)
                maxVal = arr[i];
        }

        return {minVal, maxVal};
    }
};
```

Output:-

The screenshot shows a coding platform interface with a dark theme. On the left, the 'Output Window' is open, displaying 'Compilation Results' for a custom input. It indicates 'Problem Solved Successfully' with a green checkmark. Below this, it shows 'Test Cases Passed: 1111 / 1111', 'Attempts: Correct / Total: 1 / 1', 'Accuracy: 100%', 'Points Scored: 1 / 1', and 'Time Taken: 0.05'. There are also buttons for 'Solve Next' and 'Stay Ahead With:'. On the right, the C++ code is displayed, which matches the code provided in the previous blocks. The code is for a class 'Solution' with a public method 'getMinMax' that takes a vector of integers and returns a vector containing the minimum and maximum values. The code is written in C++17 and includes a 'Start Timer' button.
