

20. Triplet Sum in Array

```
class Solution {  
public:  
    bool hasTripletSum(vector<int> &arr, int target) {  
        int n = arr.size();  
        sort(arr.begin(), arr.end());  
        for (int i = 0; i < n - 2; i++) {  
            int left = i + 1;  
            int right = n - 1;  
  
            while (left < right) {  
                int sum = arr[i] + arr[left] + arr[right];  
  
                if (sum == target) return true;  
                else if (sum < target) left++;  
                else right--;  
            }  
            return false;  
        }  
    }  
};
```

The screenshot displays a coding platform interface with a dark theme. On the left, the 'Output Window' shows 'Compilation Results' for 'Y.O.G.I. (AI Bot)'. It indicates 'Problem Solved Successfully' with a green checkmark. Below this, statistics are shown: 'Test Cases Passed: 1111 / 1111', 'Attempts: Correct / Total: 1 / 1', 'Accuracy: 100%', 'Points Scored: 4 / 4', and 'Time Taken: 0.12'. At the bottom, there are buttons for 'Solve Next' and 'Sort Elements by Decreasing Frequency', 'Zero Sum Subarrays', and 'Triplets with Smaller Sum'. On the right, the code editor shows the C++ solution for the 'Triplet Sum in Array' problem, which matches the code provided in the previous block. The code is for a class 'Solution' with a public method 'hasTripletSum' that sorts the array and uses a two-pointer technique to find triplets that sum to the target.
