

3 . Find the “Kth” max and min element of array

Input:-

```
class Solution {  
public:  
    int kthSmallest(vector<int> &arr, int k) {  
        // Sort the array  
        sort(arr.begin(), arr.end());  
  
        // Return the (k-1)th element (0-indexed)  
        return arr[k - 1];  
    }  
};
```

Output:-

The screenshot shows a C++ IDE interface. On the left, the 'Output Window' is open, displaying 'Compilation Completed' for 'Case 1'. Below this, the input is shown: 'arr[] = 7 10 4 3 20 15' and 'k = 3'. The 'Your Output:' field shows '7', and the 'Expected Output:' field also shows '7'. On the right, the code editor displays the following C++ code:

```
1 class Solution {  
2 public:  
3     int kthSmallest(vector<int> &arr, int k) {  
4         // Sort the array  
5         sort(arr.begin(), arr.end());  
6  
7         // Return the (k-1)th element (0-indexed)  
8         return arr[k - 1];  
9     }  
10 }  
11
```

At the bottom right, there are buttons for 'Custom Input', 'Compile & Run', and a green 'S' button.
