

6.find the union and intersection of two sorted array

```
class Solution {
public:
    vector<int> findUnion(vector<int> &a, vector<int> &b) {
        unordered_set<int> s;

        // Insert all elements of both vectors into set
        for (int x : a)
            s.insert(x);
        for (int x : b)
            s.insert(x);

        // Move unique elements to a vector
        vector<int> result(s.begin(), s.end());

        // Sort result since GFG prints sorted order
        sort(result.begin(), result.end());

        return result;
    }
};
```

The screenshot shows a coding platform interface. On the left, a sidebar indicates the problem is solved successfully with 1115/1115 test cases passed, 2/2 attempts, and 100% accuracy. The main editor displays a C++ code snippet for a 'rotate' function. The right sidebar shows the problem title 'C++ (17)' and a 'Start Timer' button.

```
1 class Solution {
2 public:
3     void rotate(vector<int>& arr) {
4         int n = arr.size();
5         int last = arr[n-1]; // store last element
6
7         for(int i = n-1; i > 0; i--){
8             arr[i] = arr[i-1]; // shift right
9         }
10
11         arr[0] = last; // put last element to first
12     }
13 };
14
```
